

Senior Machine Learning Engineer

The Role

Our client, a global game-tech company, strives to harness the power of modern AI algorithms to continuously improve our product and business. Their AI department, consisting of product, platform, and research teams, is at the core of that mission. They develop AI products for various applications, ranging from fraud detection to personalized gaming recommendations and from AI-powered co-pilots to CRM optimizations.

Our client structures their teams to be self-driven, autonomous, and cross-functional. As a Senior Machine Learning Engineer, you will not only deliver robust and scalable machine learning pipelines but also lead projects, mentor fellow engineers, and drive the technical vision for operationalizing ML models. You will be instrumental in elevating the team's capabilities and ensuring the successful delivery of complex AI solutions.

What You Will Do

- Lead the design and implementation of robust, scalable, and high-performance ML pipelines in a distributed environment.
- Architect and develop scalable inference pipelines and real-time model serving solutions.
- Mentor and guide other engineers on the team, fostering best practices in code quality, system design, and project execution.
- Drive project planning, create roadmaps, and take ownership of project outcomes, including post-launch reflection and identifying lessons learned.
- Collaborate closely with Data Scientists, Data Engineers, and Product Owners to translate business problems into production-ready machine learning systems.
- Implement and champion comprehensive model diagnostics, including automated evaluation, drift monitoring, and alerting flows.
- Automate model deployment using modern CI/CD and MLOps principles.
- Proactively navigate technical conflicts and guide the team toward effective solutions.

What You'll Bring

- Extensive experience in software development using Python in a large-scale, high-performance production environment.
- Proven experience leading the design of complex, scalable ML software systems and influencing broader technical outcomes.
- Significant hands-on experience with cloud environments (Microsoft Azure or AWS) and containerization/orchestration tools (e.g., Kubernetes, Docker).
- Demonstrable expertise in real-time data processing and streaming technologies (e.g., Kafka, Spark Streaming).
- Strong practical knowledge of the ML project lifecycle and MLOps tools (e.g., MLflow, Kubeflow).
- A track record of mentoring and coaching team members, providing constructive feedback, and contributing to their growth.
- Excellent problem-solving and communication skills, with an ability to articulate complex technical concepts to diverse audiences.
- Proficiency in software engineering best practices, including robust unit testing, code refactoring, and performance optimization.

Logistics

- Full-time employment contract
- Hybrid from Lisbon (1 day/week in the office) or fully remote in other parts of Portugal
- Up to 22% bonus, company card with monthly allowance, unlimited access to Udemy, private healthcare, and working equipment
- Candidates must be based in Portugal
